DOMINIC SCORDINO

AI Solutions & Enablement Engineer

Steubenville, OH · dscordino20@gmail.com · linkedin.com/in/dominicscordino

PROFESSIONAL SUMMARY

AI Engineer who maps how stakeholders' processes and workflows run today, finds the gaps, blockers, and inefficient steps, and builds a streamlined system with them that optimizes their work. Knows when a system calls for agentic vs. deterministic steps and processes. Builds on the Microsoft 365 and Azure platforms a company already runs on, keeps it running after launch, and measures what changed. Turns each engagement into reusable skills, plugins, and guides, and works with security and compliance so every rollout stays governed.

TECHNICAL SKILLS

- **AI / LLM:** Claude and Claude Code (skills, plugins, Model Context Protocol servers), Anthropic API, Azure OpenAI, Azure AI Foundry, agents and tool calling, RAG and vector search (Azure AI Search), prompt and skill libraries, LLM evaluation (LLM-as-judge), guardrails, red-teaming (PyRIT)
- **Microsoft 365 & Enterprise Systems:** Microsoft Teams apps and bots, SharePoint, Microsoft Graph, Power Automate, Microsoft Entra ID and OpenID Connect sign-in, Azure DevOps REST API, Google Drive API, REST and webhook integrations, PostgreSQL, Azure SQL, Cosmos DB
- **Enablement & Adoption:** Discovery sessions and process mapping with business teams, proofs of concept, live demos and training, onboarding and setup guides, self-service skills and plugins, adoption and usage measurement, AI tool licensing and cost modeling
- **Governance & Security:** SOC 2 and ISO compliance (point person), NIST AI Risk Management Framework, UAT and red-team sign-off before release, penetration-test triage, human-in-the-loop escalation design, least-privilege secrets (Azure Key Vault)
- **Cloud:** Microsoft Azure (Functions, App Service, Virtual Machines and networking, AI Search, AI Foundry, Key Vault, Monitor, Data Factory, Pipelines), Docker, CI/CD; Amazon Web Services (AWS Certified Solutions Architect – Associate, in progress)
- **Operations & Testing:** Production monitoring and alerts, incident fixes, runbooks, Playwright, nightly automated test runs, service mocks
- **Languages & Delivery:** Python, TypeScript, JavaScript, Node.js, React, SQL, KQL, Bash, PowerShell; Agile/Scrum, Azure DevOps, Jira, Git

PROFESSIONAL EXPERIENCE

Developer, AI Solutions & Enablement — CloudCover, Charlotte, NC · August 2025 – Present

Promoted March 2026 from Junior Software Developer.

- Mapped the engineering lead's IT support process with him, decided what to automate and where a person steps in, then built Covr, the company's IT-support assistant in Microsoft Teams (TypeScript, Microsoft 365 Agents SDK). Version 1 ingested SharePoint through a Power Automate flow; four Azure Functions on Storage Queues now sync the IT guides through Graph delta queries, chunk them at 512 tokens, and embed them into Azure AI Search. Answers ground in vector search over those guides plus Microsoft's public documentation, with citations, a confidence floor, and a two-source cap; a handoff emails IT the full chat. IT calls reaching him fell from every other day to about once every two weeks; live at 8.1.3.
- Made Covr's escalate-to-IT-personnel handoff decision predictable: replayed 29 real messages three times each, found 8 got different decisions from the model, and moved it into a code policy (offer on request or model flag, never after a decline, once per session), keeping the model's flag as a signal.
- Built the engineering team's Azure DevOps MCP server (Model Context Protocol, the standard for giving an AI assistant tools), which lets Claude Code read and act on work items, pull requests, git, pipelines, and wikis through 27 tools; used daily by the whole team. TypeScript on the official MCP SDK over stdio, each developer's own token, draft-by-default pull requests with a separate publish tool, and 105 Vitest tests behind a coverage ratchet.
- Partnered with the VP of Product after offering to help and built his discovery workflow: a Python Azure Function on a 10-minute timer pulls Teams transcripts through Graph, has Claude on Azure AI Foundry return schema-validated JSON candidates, dedupes them against the live Azure DevOps backlog (BM25-weighted lexical shortlist, then an LLM confirm), and writes a review sheet to SharePoint; first version live in one week. Also modeled his company-wide AI notetaker rollout over a three-year cost of ownership.
- Helped build and now own the company's AI-driven development process, a three-stage Claude Code pipeline: discovery turns a recorded meeting into a user story checked against the live backlog, planning files one build task per stage, and the build stage, shipped through an internal plugin marketplace I built (14 plugins), opens a tested draft pull request whose tests must raise coverage on every touched file. Added the meeting-recap path into discovery, demoed it live to 14 and then 8 teammates, and onboarded two product owners. Then measured review load (pull requests 3.3 times larger, 69% fewer review comments per 1,000 changed lines) and published eight recommendations.
- Built the network for a nightly customer-reporting copy from a VNet-injected PostgreSQL Flexible Server into Azure SQL through Data Factory: a self-hosted integration runtime on a Trusted Launch Windows VM in its own subnet, network security group rules to the Sql service tag on 1433, Key Vault secrets, and a runbook that runs it only at night.
- Tag-team the company's SOC 2 and ISO compliance and lead user-acceptance and red-team testing of its AI products before release. Built ComplianceReminders, an Azure Functions service that emails each employee their open tasks from Vanta, the compliance platform, via Microsoft Graph (196 tests, deployed in two days). Prototyped a fail-closed guardrail pipeline in Azure AI Foundry (prompt shields, content filtering, groundedness gate) with LLM-as-judge evaluations gated in CI; red-teamed a customer-facing quoting chatbot through a PyRIT harness across seven input channels, mapped to the OWASP LLM Top 10 and NIST AI RMF; and took an AI ticket-triage agent's 14-control guardrail from playground to production.
- Wrote and ran test plans and product QA for three products (60 cases, 35 bugs caught before release) and the 21-case test plan for the AI ticket-triage agent. Built the fully local Playwright stack (five outside-service stand-ins, a sign-in mock, and a guard that fails any run reaching the internet) for ServiceHub, the IT service-ticketing product, and ContractHub, the contracts product, plus the nightly Azure VM run that emails a PDF report.

Technical Project Manager & Lead Developer — ScriptOS.net (Franciscan University × USCCB) · August 2024 – May 2025

- Led a 5-engineer team to ship a production book review-and-approval application for the U.S. Conference of Catholic Bishops, delivering a full MVP in 8 months and signing 2 publishing houses as customers.
- Scoped requirements directly with the client, ran 11+ publisher demos, and ran Agile across 11 sprints (750+ Jira tasks); improved review efficiency by 40%. Built the backend with 352 tests, deployed on Azure with GitLab CI/CD.

Information Security Engineer Intern — IDEMIA Public Security, Bedford, MA · May 2024 – August 2024

- Built VUSE, a Python and PowerShell tool IDEMIA runs in production for SOC 2 audits to verify that customer sessions are encrypted.

EDUCATION

Bachelor of Science in Software Engineering, Minor in Mathematics — Franciscan University of Steubenville · May 2025 · GPA 3.60

Relevant coursework: Artificial Intelligence and Machine Learning, Software Architecture, Databases, Cybersecurity and Cryptography, Quality Assurance and Testing.

NCAA Division III Lacrosse: Volunteer Assistant Coach, Former 2-year Captain & Academic All-American Honoree.
