DOMINIC SCORDINO

AI Engineer

Steubenville, OH · dscordino20@gmail.com · linkedin.com/in/dominicscordino

PROFESSIONAL SUMMARY

AI Engineer who takes unclear tasks, turns them into secure software running in production, and owns it after launch. Builds AI products, features, RAG infrastructure, and more, then tests and protects them with evaluations, guardrails, verification and validation (V&V), and red-teaming. Works fast, ships finished work, and adapts quickly across AI, cloud, testing, and product.

TECHNICAL SKILLS

- **AI / LLM:** AI agents, multi-agent orchestration, Model Context Protocol (MCP) servers, RAG, embeddings and vector search (Azure AI Search), prompt and skill engineering, LLM evaluation (LLM-as-judge, Azure AI Evaluation), guardrails, red-teaming (PyRIT), Claude Code, Anthropic API, Azure OpenAI, Azure AI Foundry
- **Cloud / Infrastructure:** Microsoft Azure (Functions, App Service, AI Search, AI Foundry, Monitor, Key Vault, Data Factory, DevOps), CI/CD (Azure Pipelines); Amazon Web Services (studying for AWS Certified Solutions Architect)
- **Languages:** Python, TypeScript, JavaScript, SQL, KQL, Bash, PowerShell, Ruby on Rails
- **Testing & Quality:** Playwright, test-driven development, hermetic local test environments, service mocks, CI quality gates
- **Data / Machine Learning:** ETL and ingestion pipelines, TensorFlow, scikit-learn, Pandas, NumPy, OpenCV
- **Web / Backend:** Node.js, React, Next.js, PostgreSQL, REST APIs, OpenID Connect
- **Delivery:** Requirements gathering, stakeholder demos, Agile/Scrum, Azure DevOps, Jira, Git, GitLab

PROFESSIONAL EXPERIENCE

AI & Cloud Engineer — CloudCover, Charlotte, NC · August 2025 – Present

Promoted March 2026 from Junior Software Developer.

- Built and shipped Covr, a Microsoft Teams assistant on Azure with a pluggable Azure OpenAI and Anthropic Claude provider layer. Designed its RAG pipeline (SharePoint into an Azure AI Search vector store, batched embeddings, gap-ratio relevance filtering, orphan cleanup on re-sync), then extended it into an IT-support bot that escalates to human support with full conversation context and attachments.
- Prototyped AI evaluations and guardrails in Azure AI Foundry (LLM-as-judge, prompt-injection shields, content-safety filtering, a runtime groundedness gate), then red-teamed a customer-facing quoting chatbot with PyRIT, scored by attack success rate and structured on the NIST AI Risk Management Framework. Own the guardrails and the Azure AI Foundry model and embedding deployment for a new AI ticket-triage agent, and set up its guardrail and production model deployment.
- Helped develop and roll out the team's AI-driven development process, a three-skill Claude pipeline (product-discovery, architecture-planning, dev-task) that takes a feature from recorded meeting to requirements, an architecture plan, and a tested, review-ready pull request. Reviewed the dev-task plugin's pull requests, set up new repositories to run it, onboarded product owners onto the discovery skill, and filed the bugs found in use.
- Built the engineering team's Model Context Protocol (MCP) server: a 25-tool API over Azure DevOps work items, pull requests, git, pipelines, and wikis, used daily by the whole team. Added draft pull request support, review-thread replies, CI lint, format, and docs gates, and its first test suite.
- Built an internal Claude Code plugin marketplace (14 plugins), including an autonomous agent that took a work item from triage to a review-ready pull request in an isolated git worktree. Benchmarked its runs against the original human fixes, and one run's fix merged to production. Built and used a suite of Playwright Claude skills that author, build, and archive test specs for the product's automated test suite. Now ship production bug fixes test-first through a skill-based AI pipeline.
- Built the Playwright test suite (20+ projects) for ServiceHub, CloudCover's IT service-ticketing platform, passing its 80% scenario-coverage target in one month, then moved it off the shared test environment onto a hermetic local stack so every run is reproducible on a developer's machine. Sized and built an Azure VM from measured CPU usage that now runs the suite unattended every night through Azure Pipelines and emails a report of each run.
- Built the service mocks for the Playwright test environment: fixture-driven stand-ins for the permissions service, a contract-management API, Ably realtime messaging, Google geolocation, and a blob-storage relay, plus an OpenID Connect login mock with 21 test identities. The Playwright runner injects the mocks at run time, so committed config and developers' normal startup stay unchanged. A proxy-based egress sentinel records every outbound call a Playwright run makes, proving it stayed local; it caught leaks, closed by serving fonts, flag images, and map tiles locally.
- Seeded Playwright test data against measured failures, not guesses: built a flag that lifts only the skip on deployed-only Playwright specs, ran every skipped spec locally, and found 13 of 15 blocked by the same missing test fixture. Wrote and ran integration and cross-tenant test plans for three products (45 cases) and filed 18 bugs.
- Built the infrastructure for a nightly Azure Data Factory pipeline from PostgreSQL to Azure SQL: a self-hosted integration runtime on a hardened Windows VM in the database's private network (Trusted Launch, default-deny firewall, Key Vault secrets), and fixed the network rules blocking it.
- Built an AI product-discovery agent for the VP of Product that turns Teams meeting transcripts into discovery workbooks through Microsoft Graph and SharePoint, and a daily competitive-intelligence skill that fans out parallel search agents, tiers sources by credibility, and fact-checks every item.

Technical Project Manager & Lead Developer — ScriptOS.net (Franciscan University × USCCB) · August 2024 – May 2025

- Led a 5-engineer team to ship a production book review-and-approval application for the U.S. Conference of Catholic Bishops, delivering a full MVP in 8 months and signing 2 publishing houses as customers.
- Ran Agile across 11 sprints; scoped requirements with stakeholders, tracked 750+ Jira tasks, ran 11+ publisher demos. Improved review efficiency by 40%.
- Built the backend (controllers, models, schema, and migrations) with 352 backend tests; deployed on Azure with GitLab CI/CD.

Information Security Engineer Intern — IDEMIA Public Security, Bedford, MA · May 2024 – August 2024

- Built VUSE (Verification of User Session Encryption), a Python and PowerShell tool used in SOC 2 audits to verify that customer sessions are encrypted.
- Validated client- and server-side web certificates (Windows IIS) via Certificate Authority and Active Directory Certificate Services, generating valid, expired, and mismatched test certificates.

EDUCATION

Bachelor of Science in Software Engineering, Minor in Mathematics — Franciscan University of Steubenville · May 2025 · GPA 3.60

Relevant coursework: Artificial Intelligence and Machine Learning, Software Architecture, Databases, Cybersecurity and Cryptography, Quality Assurance and Testing.

NCAA Division III Lacrosse: Volunteer Assistant Coach, Former 2-year Captain & Academic All-American Honoree.
